Code Review Template β

Me: Jamie My Partner: Jadon

Show Your Code To Your Partner
Please only show, ***do not send your code directly via email, slack, github or other means****.*

An important aspect of code reviews is to remain polite and professional. Try to focus your comments on constructive criticism (concrete and specific changes that would improve the code). A helpful strategy is to make sure you're discussing and criticizing ***the code*** and ***not the person / author***.

Overview
Have your partner show you all the code they wrote so far.

How many files are there? 7

How many functions are there? 20

How many lines of code are there in total? 390

Estimate the completeness of your partners code. 45 %
0% (started working in class today) – 100% (finished)
Note: It's not necessary to have the project 100% complete at this time.

Constructive Criticism
Give your partner one piece of constructive criticism regarding their code. Consider the backside of this document for inspiration about what you can say.

Maybe add in a adj-list as a hashmap because with large graphs it speeds up the run time significantly.

Question
Write down one question you asked your partner about their code.

Who did he implement GetOutwardEdges() - Do you use an adjacency list/matrix in code or a for loop? Seems he just uses a for loop, which works fine and is less memory allocation for data storage than a hashmap but does have a slower run time when using large graphs, or graphs with more edges

Style & Readability

Is proper indentation used?

Are {'s and }'s placed appropriately and consistently?

Are variable and function names appropriately short and descriptive?

Are there comments that answer the question "Why?"

Are comments given in the most appropriate places in the code?

Comments Given where needed and explains what the functions do and why

Style kept throughout the project.

Assignment Instructions

Does the code correctly follow the assignment instructions?

If you and your partner made different choices for a specific segment of code, do the assignment instructions allow for both choices?

I have an adj_list, he does not, this isn't something mandated since we can implement the methods how we wish but it is a difference.

Bugs, Pitfalls and Potential Hazards

Did a spot a bug?

Does your partner's code differ from yours in a specific function or area? Is one approach better than the other?

Production Environment and Development Environment

Are there any issues with git, GitHub, Make, g++ or any other aspect(s) of development operations?

Can compile and run the graph tests
